**Note:** TCP/IP should already be installed. If it is not, it must be installed from the VMS binaries CD.

## TCP/IP Configuration

### TCPIP\$CONFIG

1.1) Remove all other users.

1.2) Login as SYSTEM

1.3) Type Command line: @sys\$manager:tcpip\$config

Then the following menu will be displayed:

```
HP TCP/IP Services for OpenVMS Configuration Menu
Configuration options
1 - Core environment
```

```
2 - Client components
3 - Server components
4 - Optional components
5 - Shutdown HP TCP/IP Services for OpenVMS
6 - Startup HP TCP/IP Services for OpenVMS
7 - Run tests
A - Configure options 1 - 4

[E] - Exit configuration procedure
```

Enter configuration option:

### 'Core Environment'

Options 2, 3 & 4 must be configured. Options 1 and 5 are optional.

Option 1 'Core Environment'.

```
HP TCP/IP Services for OpenVMS Core Environment Configuration Menu
Configuration options:
1 - Domain
2 - Interfaces
3 - Routing
4 - BIND Resolver
5 - Time Zone
A - Configure options 1 - 5
```

```
[E] - Exit menu
```

Enter configuration option:

Select Option 2 'Interfaces'

**Note:** On Itanium Servers and Alpha Server DS10 model there are two ethernet ports, WE0 and WE1. At this stage only WE0 should be configured.

The following question will be asked:

```
WE0 is the Ethernet device EWA0:
```

```
WE0 has not been configured
```

```
HP TCP/IP Services for OpenVMS Interface WE0 Configuration Menu
```

Configuration options:

```
1 - Configure interface manually
2 - Let DHCP configure interface
```

```
[E] - Exit menu (Do not configure interface WE0)
```

Enter configuration option:

### Configure interface manually

Under most circumstances, the interface should be configured manually to use a static IP address, by selecting option 1.

You will be prompted for the following information (ask the local system administrator to provide this information):

Enter fully qualified host name:

Enter the full host name for the system. This should include the domain name, if appropriate. eg. system1.iptest.com

Enter Internet address for system1.iptest.com:

Enter the full "dotted-quad" IP address that has been assigned to this system. e.g.: 192.168.10.23

Enter Internet network mask for system1.iptest.com [255.255.0.0]:

Enter the network mask for the system. The default option will usually be correct, but check with the local system administrator.

```
Enter broadcast mask for system1.iptest.com [192.168.255.255]:
```

Enter Broadcast mask for the system. The default option will usually be correct.

```
The following parameters will be used to define the  
Internet interface WE0:
```

```
Host name: system1.iptest.com  
Internet address: 192.168.10.23  
Network mask: 255.255.0.0  
Broadcast mask: 192.168.255.255
```

```
* Is the above correct [YES] :
```

If the details are correct, enter "Yes" and press return. Otherwise enter "No" and make corrections.

On Itanium models that are fitted with two network interfaces, you will be prompted to configure the second interface, WE1, now. Unless specifically required at the local site, this should not be configured.

### Use DHCP to configure interface

If the local network uses DHCP auto-configuration, and it is required for this host, select option 2. If you do this, you may be presented with the "DHCP\_Client Configuration" options. You should select option 2 "Enable and Start service on this node".

Please note that it is not always appropriate to use DHCP. Review the intended role of the host and ensure that dynamic addressing is suitable before enabling this option.

On Itanium models that are fitted with two network interfaces, you will be prompted to configure the second interface, WE1, now. Unless specifically required at the local site, this should not be configured.

After configuring the interfaces, you will be asked which interface is the Primary DHCP Interface. Specify the first interface (WE0) to be the Primary DHCP interface.

The procedure will now return to the "Core Environment" menu.

Select Option 2 'Domain'

```
Enter Internet domain:
```

Enter the domain suffix for the local site. eg. iptest.com

The procedure will now return to the "Core Environment" menu.

The procedure will now return to the "Core Environment" menu.

If necessary, select Option 3 'Routing'. This will be necessary if the Itanium requires a "Default Gateway" or "Default Route" to access other systems on the network.

```
* Do you want to configure dynamic ROUTED or GATED routing [NO] :
```

Answer "No".

```
* Do you want to configure a default route [YES] :
```

If the system administrator has provided an IP or host address for a Default Gateway or Default Route, answer "Yes".

```
Enter your Default Gateway host name or address:
```

Enter the "dotted-quad" IP address of the Default Gateway. eg: 192.169.10.254

```
192.168.10.254 is not in the local host database.  
If you want to enter the default gateway in the local host  
database, enter its host name. Otherwise, enter <CR>.
```

```
Enter the Default Gateway host name []:
```

If the system administrator has provided a host name that corresponds to the Default Gateway, enter it now. Otherwise, just press return.

The procedure will now return to the "Core Environment" menu.

Enter "E" to return to the main TCP/IP Services menu.

The TCP/IP network environment is now configured. If specific TCP/IP client or server components are required, refer to Appendix [F1.3](#) and [F1.4](#) for documentation on configuring those services.

From the TCP/IP Services menu, select option 6 to start TCP/IP networking.

To enable TCP/IP networking to start automatically when the Itanium is booted, edit the main VMS startup file:

```
$ edit sys$login:systartup_vms.com
```

Locate the following line in this text file:

```
$!$ @SYS$STARTUP:TCPIP$STARTUP.COM
```

Remove the comment marker (!) from the start of the line.

Locate the following section, and add comment markers (!) at the start of each line:

```
$ SCSNODE = F$EDIT(F$GETSYI("SCSNODE"), "COMPRESS,TRIM")  
$ DEFINE/SYSTEM TCPIP$INET_HOST 'SCSNODE'  
$ DEFINE/SYSTEM TCPIP$INET_HOST 'SCSNODE'
```

Now save and exit from the file.

## BIND Resolver Configuration

If the local network provide a DNS name resolution service. Use the BIND Resolver utility to configure your DNS details.

To use the BIND resolver utility open a terminal window and login as "system".

Once the terminal has loaded enter:

```
$ @tcpip$config
```

Once the menu has appeared select option 1 - Core Environment, followed by option 4 - BIND Resolver.

If you have not used the BIND Resolver utility before you will be prompted to:

```
Enter your BIND server name:
```

Enter the internet address of the local BIND (DNS) server. e.g.: 192.168.10.10

Next you will be asked to:

```
Enter remote BIND server name:
```

This can be skipped by pressing enter.

You will be then prompted to:

```
Enter next BIND server name:
```

This can also be skipped by pressing enter to continue.

You will be returned back to the menu and if you select option 4 again it should now display your new BIND resolver configurations. To return back to the menu. Answer with NO and press enter.

To ensure the configurations are setup. While in the menu screen, selected option 5 - Shutdown HP TCP/IP Services for OpenVMS, followed by option 6 - Startup HP TCP/IP Services for OpenVMS

To test that the BIND configurations are working you can run a ping command via terminal and see if a successful communication is established. For example:

```
$ tcpip ping 192.168.10.10
```

## Client Components

From the main TCP/IP Menu, Select Option 2 'Client Components'.

**Note:** See glossary for acronyms.

HP TCP/IP Services for OpenVMS Client Components Configuration Menu

Configuration options:

1 - FTP	Disabled	Stopped
2 - NFS Client	Disabled	Stopped
3 - REXEC and RSH	Disabled	Stopped
4 - RLOGIN	Disabled	Stopped
5 - SMTP	Disabled	Stopped
6 - TELNET	Disabled	Stopped
7 - DHCP	Disabled	Stopped
8 - Telnetsym	Disabled	Stopped

```
A - Configure options 1 - 8
```

```
[E] - Exit menu
```

```
Enter configuration option:
```

Each component can be configured, and then enabled and started. Enable only the components that are necessary for the local site.

## Server Components

From the main TCP/IP Menu, Select Option 3 'Server Components' – This is optional.

Enable the necessary server services, further services should be enabled as required.

```
HP TCP/IP Services for OpenVMS Server Components Configuration Menu
```

```
Configuration options:
```

1 - BIND	Disabled Stopped	12 - NTP	Disabled Stopped
2 - BOOTP	Disabled Stopped	13 - PC-NFS	Disabled Stopped
3 - DHCP	Disabled Stopped	14 - POP	Disabled Stopped
4 - FINGER	Disabled Stopped	15 - PORTMAPPER	Disabled Stopped
5 - FTP	Disabled Stopped	16 - RLOGIN	Disabled Stopped
6 - IMAP	Disabled Stopped	17 - RMT	Disabled Stopped
7 - LBROKER	Disabled Stopped	18 - SNMP	Disabled Stopped
8 - LPR/LPD	Disabled Stopped	19 - TELNET	Disabled Stopped
9 - METRIC	Disabled Stopped	20 - TFTCP	Disabled Stopped
10 - NFS	Disabled Stopped	21 - XDM	Disabled Stopped
11 - LOCKD/STATD	Disabled Stopped		

```
A - Configure options 1 - 21
```

```
[E] - Exit menu
```

```
Enter configuration option:
```

Each component can be configured from this menu, then enabled and started. Enable only those components that are necessary for the local site.

See [glossary](#) for acronyms.

## Testing

From the TCPIP\$CONFIG main menu, select option 7 (Run Tests) to confirm the configuration. From the Run Tests menu choose option 1 (Internet IVP) only. This tests the configuration of TCP/IP on the local machine only. Do NOT run option 2 (SNMP IVP).

To test communication between the local Itanium and another TCP/IP-enabled computer, enter the following command at the DCL prompt:

```
$ tcipp
```

This enters the TCPIP command mode. You can now test TCP/IP network using the "ping" and "traceroute" commands. For example:

```
TCPIP> ping 192.168.10.20
PING 192.168.10.20 (192.168.10.20): 56 data bytes
64 bytes from 192.168.10.20: icmp_seq=0 ttl=128 time=0 ms
64 bytes from 192.168.10.20: icmp_seq=1 ttl=128 time=0 ms
64 bytes from 192.168.10.20: icmp_seq=2 ttl=128 time=0 ms
64 bytes from 192.168.10.20: icmp_seq=3 ttl=128 time=0 ms

----192.168.10.20 PING Statistics----
4 packets transmitted, 4 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/0/0 ms
```

## Changing IP Address or Hostname

Rerun TCPIP\$CONFIG and select "Core Environment". Select "Interfaces" from the next menu. Then change the IP address and/or Hostname as required. The system will ask if multiple IP addresses are required on this system, answer NO.

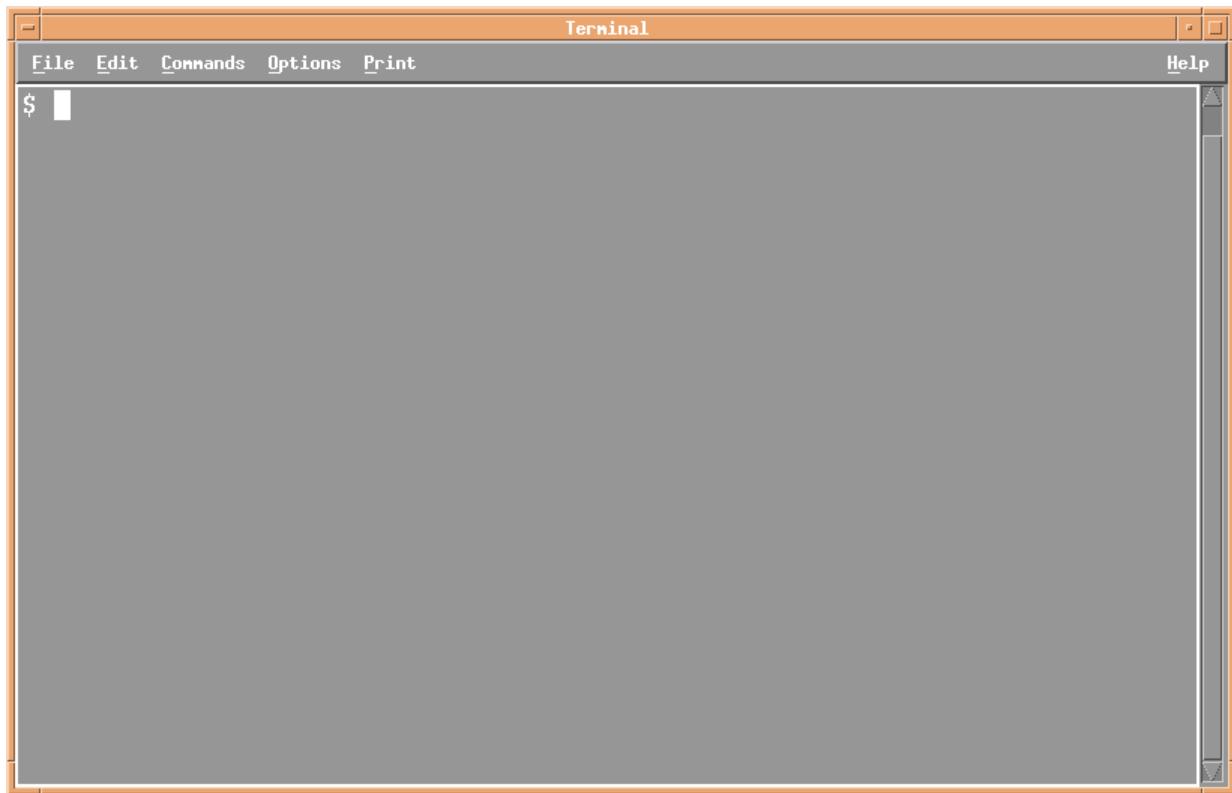

## NTP Setup

NTP (Network Time Protocol) synchronises the time on the TESTER to another specified server(s), which has an NTP Server configured on it. This allows for a TESTER to match the local timezone and be inline with other equipment in the factory.

## Timezone Adjustment

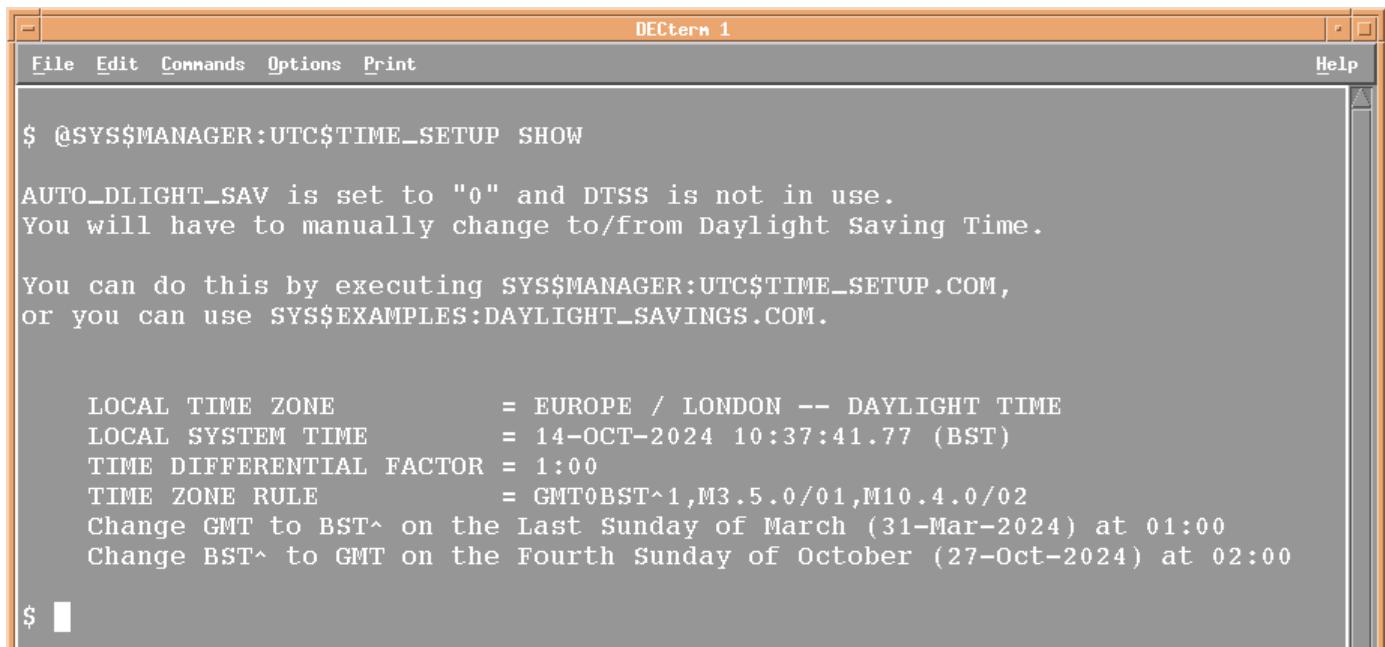

By default a TESTER will likely have been set to the UK Timezone during its initial setup. As a first step it is recommended to configure the OpenVMS Controller to its new local timezone as a backup solution if the OpenVMS Controllers connection to an NTP server is suddenly lost.

To update the timezone settings on an OpenVMS Controller, first login to the `SYSTEM` account and open a Terminal Window.

Once the Terminal Window has launched, executing the following command:

```
$ @SYS$MANAGER:UTC$TIME_SETUP SHOW
```

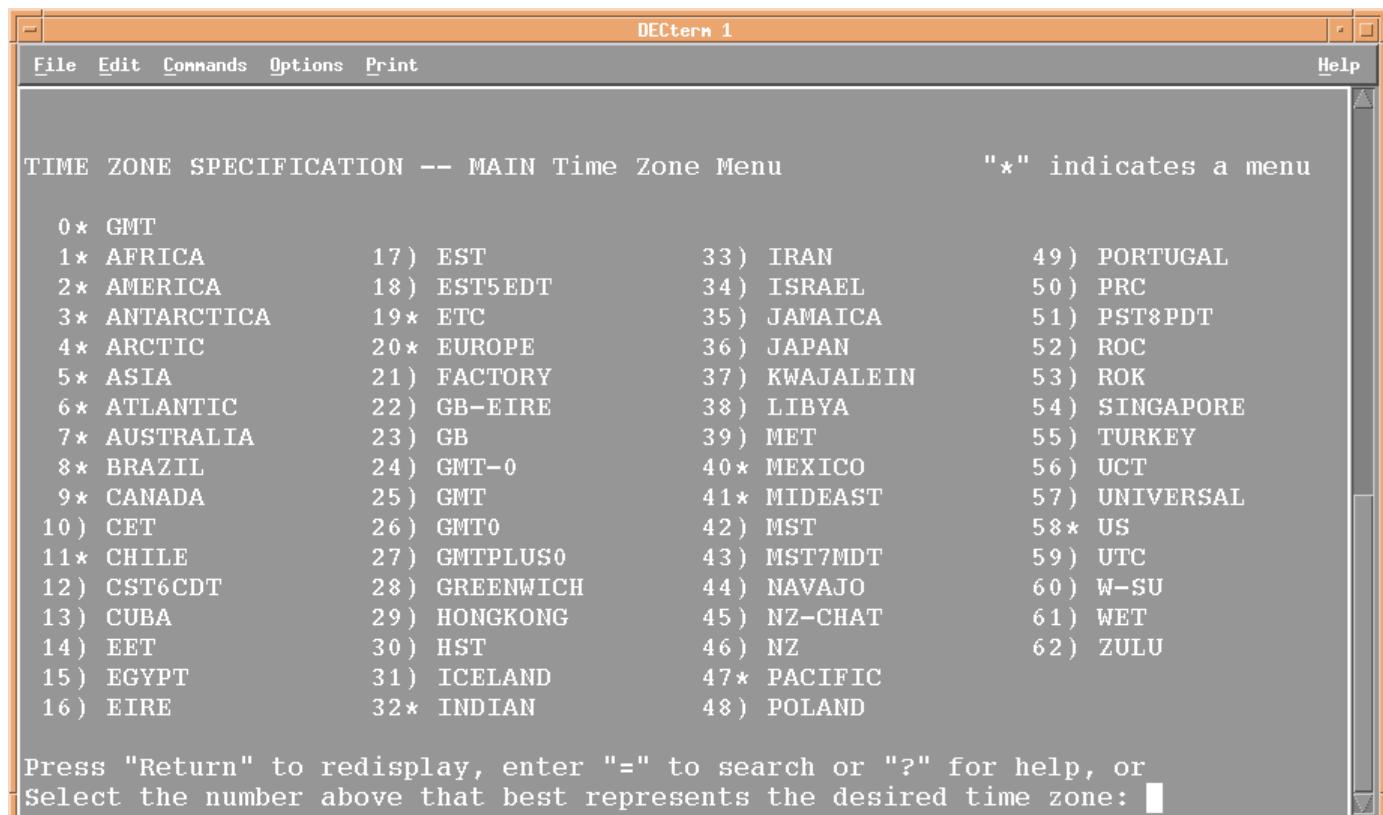

After executing the above command, you should be able to see what timezone has been set on the OpenVMS Controller.

If the timezone on the OpenVMS Controller is not set to the desired region then execute the following command:

```
$ @SYS$MANAGER:UTC$TIME_SETUP
```

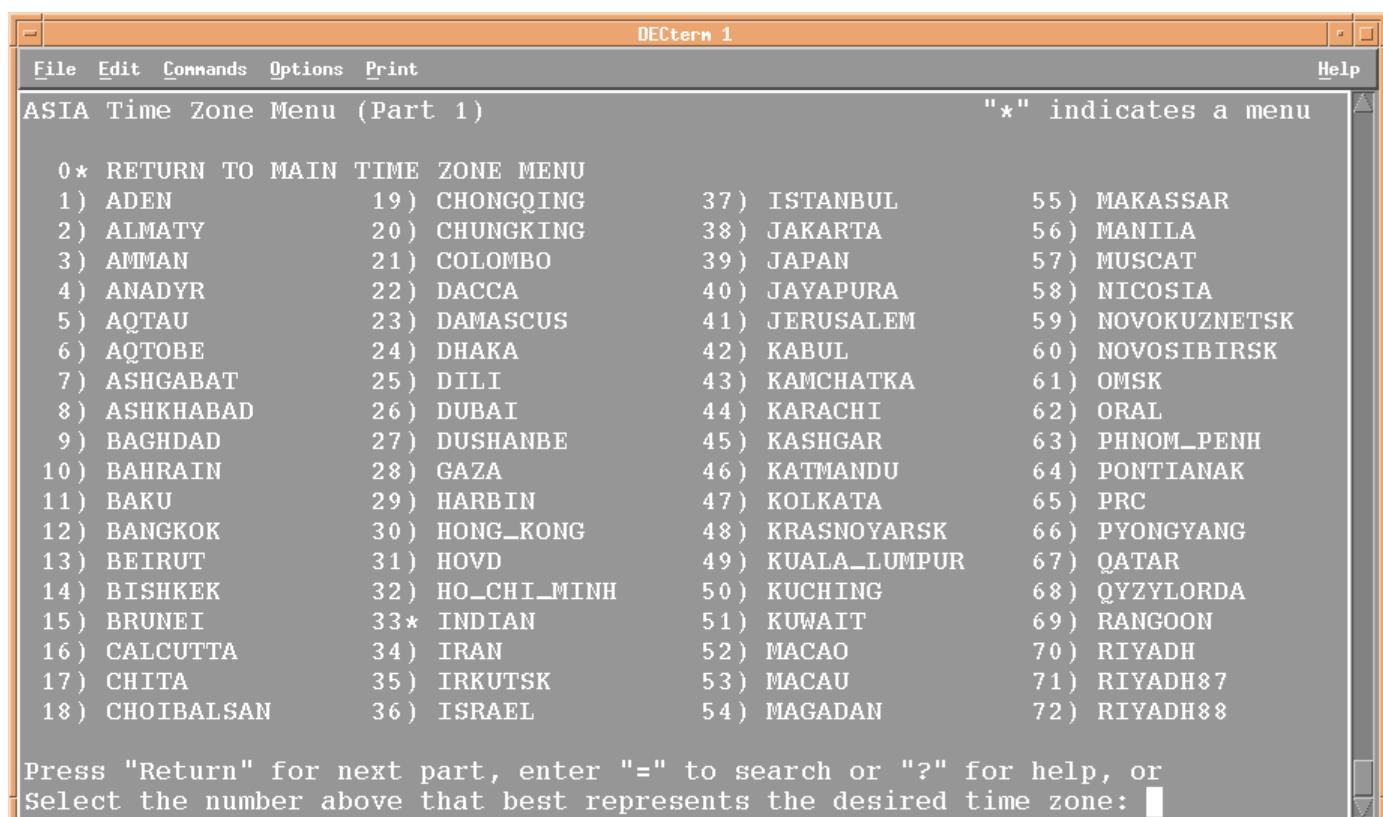

**NOTE:** The following is an alternative command to use for identifying the current timezone:  
\$ TYPE SYS\$SYSDEVICE:[VMS\$COMMON.SYSEXEC]SYS\$TIMEZONE\_SRC.DAT

After executing the above command, you will be presented with the following menu:

Please select the option most applicable to the desired location. For some of the options you will see an asterisk (\*), this means there are more options available.

In this example we will update the current OpenVMS Controller timezone to Malaysia. To do this, please select option 5. Which will give the following options:

In the new set of menu options, enter 49 to select Kuala\_Lumpur as the desired timezone. You will then be prompted to confirm your input, please select the Enter key to continue.

Press "Return" for next part, enter "=" to search or "?" for help, or  
Select the number above that best represents the desired time zone: 49

You selected ASIA / KUALA\_LUMPUR as your time zone.  
Is this correct? (Yes/No) [YES]:

You will then be asked to confirm the timezone difference, the default is set to 8:00 hour difference, if this is correct, select the Enter key to continue:

The screenshot shows a terminal window titled 'DECterm 1' with a menu bar: File, Edit, Commands, Options, Print, Help. The window contains the following text:

```
Press "Return" for next part, enter "=" to search or "?" for help, or
Select the number above that best represents the desired time zone: 49

You selected ASIA / KUALA_LUMPUR as your time zone.
Is this correct? (Yes/No) [YES]: 
```

Below this, the text 'Configuring the Time Differential Factor (TDF)' is displayed. The following text is also present:

Default Time Differential Factor is 8:00.

The Time Differential Factor (TDF) is the difference between your system time and Coordinated Universal Time (UTC). UTC is similar in most respects to Greenwich Mean Time (GMT).

The TDF is expressed as hours and minutes, and should be entered in the hh:mm format. TDFs for the Americas will be negative (-3:00, -4:00, etc.); TDFs for Europe, Africa, Asia and Australia will be positive (1:00, 2:00, etc.).

Enter the Time Differential Factor [8:00]:

You will then be asked to confirm if you have a seasonal time change in effect, for example day light savings, if not, then simply press the Enter key to continue.

The screenshot shows a terminal window titled 'DECterm 1' with a menu bar: File, Edit, Commands, Options, Print, Help. The window contains the following text:

```
Enter the Time Differential Factor [8:00]: 
```

If this is a seasonal time change, it may also be necessary to modify the system time. Generally, seasonal time changes result in adding 1:00 hour, or adding -1:00 hour to the system time.

Do you wish to modify the local system time [N]:

Then be asked to confirm if the settings are correct, if so, press the Enter key to continue.

The screenshot shows a terminal window titled 'DECterm 1' with a menu bar: File, Edit, Commands, Options, Print, Help. The window contains the following text:

```
Do you wish to modify the local system time [N]: 
```

NEW SYSTEM TIME DIFFERENTIAL FACTOR = 8:00

Is this correct? [Y]:

## NTP Server Sync Setup

If your factory has an NTP Server and you know the address, it is first recommended to confirm the OpenVMS Controller can communicate with it before moving onto the steps listed in this section.

First login to the SYSTEM account and open a Terminal Window. In this example we will be using the hostname pool.ntp.org for our UK NTP server.

In the Terminal Window, please execute the following command:

```
$ TCPIP PING POOL.NTP.ORG
```

If there is a successful communication between the OpenVMS Controller and the NTP Server, the Terminal Will output messages like what is shown below:

```
$ tcpip ping pool.ntp.org
PING pool.ntp.org (131.111.8.60): 56 data bytes
64 bytes from 131.111.8.60: icmp_seq=0 ttl=43 time=9 ms
64 bytes from 131.111.8.60: icmp_seq=1 ttl=43 time=10 ms
64 bytes from 131.111.8.60: icmp_seq=2 ttl=43 time=21 ms
64 bytes from 131.111.8.60: icmp_seq=3 ttl=43 time=9 ms

----pool.ntp.org PING Statistics----
4 packets transmitted, 4 packets received, 0% packet loss
round-trip (ms) min/avg/max = 9/12/21 ms
$
```

After confirming your OpenVMS Controller can communicate with the NTP Server, for your OpenVMS Controller to keep your timezone continuously in sync you will need to add an entry into the `SYSTARTUP_VMS.COM` file.

While still logged into the `SYSTEM` account. Execute the following command to start editing the `SYSTARTUP_VMS.COM` file.

```
$ EDIT SYSTARTUP_VMS.COM
```

```
DECterm 1
File Edit Commands Options Print Help
$ EDIT SYSTARTUP_VMS.COM
```

After executing the above command. It is recommended to do a search just to be sure there are no NTP settings already present in the `SYSTARTUP_VMS.COM` file. Select the `DO` key on your OpenVMS Keyboard, or the `F10` on the PC Keyboard and a `Command:` prompt should appear.

```
$! When you upgrade your OpenVMS system, you should check the new version
$! SYS$MANAGER:SYSTARTUP_VMS.TEMPLATE for any new or changed commands you
$! may wish to include in your site specific SYS$MANAGER:SYSTARTUP_VMS.C
$!
Buffer: SYSTARTUP_VMS.COM | Write | Insert |
Command: [REDACTED]
438 lines read from file SYS$COMMON:[SYSMGR]SYSTARTUP_VMS.COM; 24
```

In the `Command:` prompt, enter the following and then press the Enter key:

```
Command: FIND NTP
```

```
$! When you upgrade your OpenVMS system, you should check the new version
$! SYS$MANAGER:SYSTARTUP_VMS.TEMPLATE for any new or changed commands you
$! may wish to include in your site specific SYS$MANAGER:SYSTARTUP_VMS.C
$!
Buffer: SYSTARTUP_VMS.COM | Write | Insert |
Command: FIND NTP [REDACTED]
Could not find: NTP
```

If there are no results found a message will appear confirming that there were no results for the word `NTP`.

After confirming there are no existing records to `NTP` in the `SYSTARTUP_VMS.COM` file, scroll down the Terminal Window until you reach the bottom of the file.

The screenshot shows a terminal window titled "DECterm 1". The menu bar includes "File", "Edit", "Commands", "Options", "Print", "Help", and a separator line. The main window displays a configuration script:

```
$!
$! @SYS$SPECIFIC:[SYSS$STARTUP]PCI488$CONFIGURE.COM
$!
$!
$! Commands to initialise remote JetDirect printer on queue net$print
$! mcr latcp create port LTA100: /application
$! set device LTA100: /spooled=net$print
$! define/system $netprinter LTA100:
$! define/system tcip$telnetsym_raw_tcp 1
$! define/system tcip$telnetsym_suppress_formfeeds 1
$! DEFINE /FORM POST /WIDTH=5000 /LENGTH=255 1
$! set queue /form=POST /default=(form=post) net$print
$! start/queue net$print
$!
$! def/sys sys$print net$print
$! def/sys $printer $netprinter
$!
$! @SYS$COMMON:[SYSMGR]VIEWDOC
$!
$ EXIT
[End of file]
```

The status bar at the bottom shows "Buffer: SYSTARTUP\_VMS.COM" and "Write | Insert |".

Once at the bottom of the file, enter the following just above the \$ EXIT line:

```
$! SETUP NTP SYNC
$ @SYS$MANAGER:TCPIP$DEFINE_COMMANDS
$ NTPDATE pool.ntp.org
```

**NOTE:** It is important that the line: @SYS\$MANAGER:TCPIP\$DEFINE\_COMMANDS is above NTPDATE... else the command will not work.

The screenshot shows the terminal window with the completed configuration script:

```
$!
$! SETUP NTP SYNC
$ @SYS$MANAGER:TCPIP$DEFINE_COMMANDS
$ NTPDATE pool.ntp.org
$ EXIT
[End of file]
```

The status bar at the bottom shows "Buffer: SYSTARTUP\_VMS.COM" and "Write | Insert |".

After inputting the above information into the SYSTARTUP\_VMS.COM file, the changes can be saved. To do this, press the DO or F10 key on your Keyboard and in the Command: prompt, enter: EXIT followed by the Enter key.

The screenshot shows the terminal window with the command prompt:

```
$! SETUP NTP SYNC
$ @SYS$MANAGER:TCPIP$DEFINE_COMMANDS
$ NTPDATE pool.ntp.org
$ EXIT
[End of file]
```

The status bar at the bottom shows "Buffer: SYSTARTUP\_VMS.COM" and "Write | Insert |".

If the editor was successfully exited from the Terminal Window, you will see a message appear confirming that changes have been written to the SYSTARTUP\_VMS.COM file.

The setup is complete and now whenever the OpenVMS Controller is restarted, a timezone sync will be performed as part of the boot process.

**NOTE:** It is recommended to perform a single restart after completing this section of the MANUALS, just to confirm the OpenVMS Controllers can successfully reboot.

## NTPDATE UTILITY

This utility will help you to perform an on-demand sync of the OpenVMS Controller local time with an NTP server:

Open a Terminal Window and execute the following commands. In this example we will use `pool.ntp.org` as the NTP server.

```
@SYS$MANAGER:TCPIP$DEFINE_COMMANDS  
NTPDATE nnn.nnn.nnn.nnn  
SHOW TIME
```

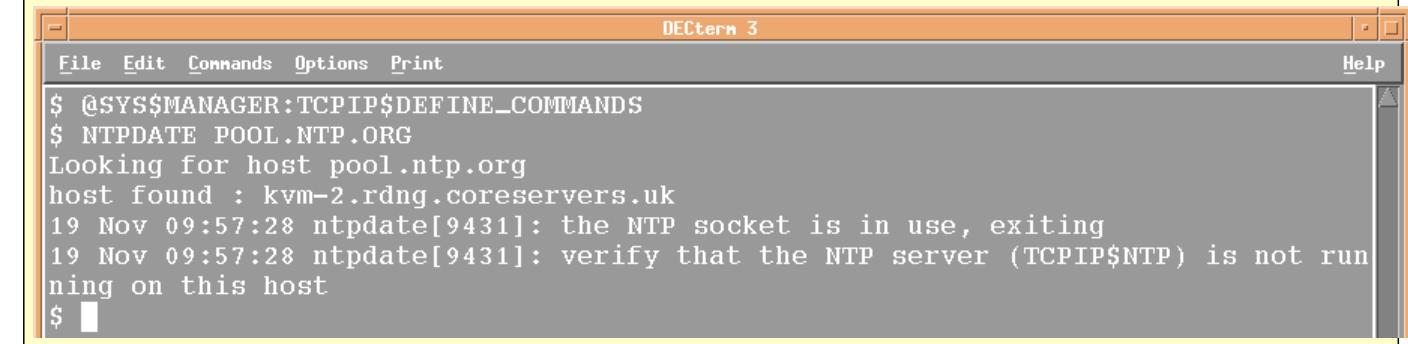

**NOTE:** Where `nnn.nnn.nnn.nnn` is the TCP/IP address of the server you want to sync to, if using an IP Address instead of a hostname.

The screenshot shows a terminal window titled "DECterm 3". The menu bar includes "File", "Edit", "Commands", "Options", "Print", and "Help". The command entered is \$ @SYS\$MANAGER:TCPIP\$DEFINE\_COMMANDS followed by \$ NTPDATE POOL.NTP.ORG. The output shows the system looking for host pool.ntp.org, finding it as cheddar.halon.org.uk, and displaying the step time server information: 18 Nov 18:35:25 ntpdate[9431]: step time server 93.93.131.118 offset 0.026266 sec. A small icon of a monitor and keyboard is visible in the bottom left corner of the terminal window.

```
$ @SYS$MANAGER:TCPIP$DEFINE_COMMANDS  
$ NTPDATE POOL.NTP.ORG  
Looking for host pool.ntp.org  
host found : cheddar.halon.org.uk  
18 Nov 18:35:25 ntpdate[9431]: step time server 93.93.131.118 offset 0.026266 sec  
C  
$
```

**Note:** The NTP Server service must **NOT** be running otherwise the NTPDATE will give an in use error. Like the one shown below:

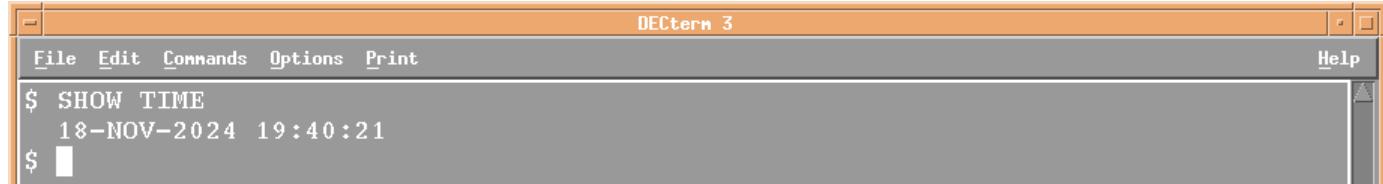

The screenshot shows a terminal window titled "DECterm 3". The menu bar includes "File", "Edit", "Commands", "Options", "Print", and "Help". The command entered is \$ @SYS\$MANAGER:TCPIP\$DEFINE\_COMMANDS followed by \$ NTPDATE POOL.NTP.ORG. The output shows the system looking for host pool.ntp.org, finding it as kvm-2.rdns.coreservers.uk, and then reporting an error: 19 Nov 09:57:28 ntpdate[9431]: the NTP socket is in use, exiting and 19 Nov 09:57:28 ntpdate[9431]: verify that the NTP server (TCPIP\$NTP) is not running on this host. A small icon of a monitor and keyboard is visible in the bottom left corner of the terminal window.

```
$ @SYS$MANAGER:TCPIP$DEFINE_COMMANDS  
$ NTPDATE POOL.NTP.ORG  
Looking for host pool.ntp.org  
host found : kvm-2.rdns.coreservers.uk  
19 Nov 09:57:28 ntpdate[9431]: the NTP socket is in use, exiting  
19 Nov 09:57:28 ntpdate[9431]: verify that the NTP server (TCPIP$NTP) is not running on this host  
$
```

If you want to confirm what the OpenVMS Controller time has now been set to, execute the following command:

```
$ SHOW TIME
```

The screenshot shows a terminal window titled "DECterm 3". The menu bar includes "File", "Edit", "Commands", "Options", "Print", and "Help". The command entered is \$ SHOW TIME. The output shows the current date and time as 18-NOV-2024 19:40:21. A small icon of a monitor and keyboard is visible in the bottom left corner of the terminal window.

```
$ SHOW TIME  
18-NOV-2024 19:40:21  
$
```

## NTP Server

Enabling NTP server will keep the time updated. Configure NTP as follows:

**Note:** NTP will not update the time unless it is approximately correct first

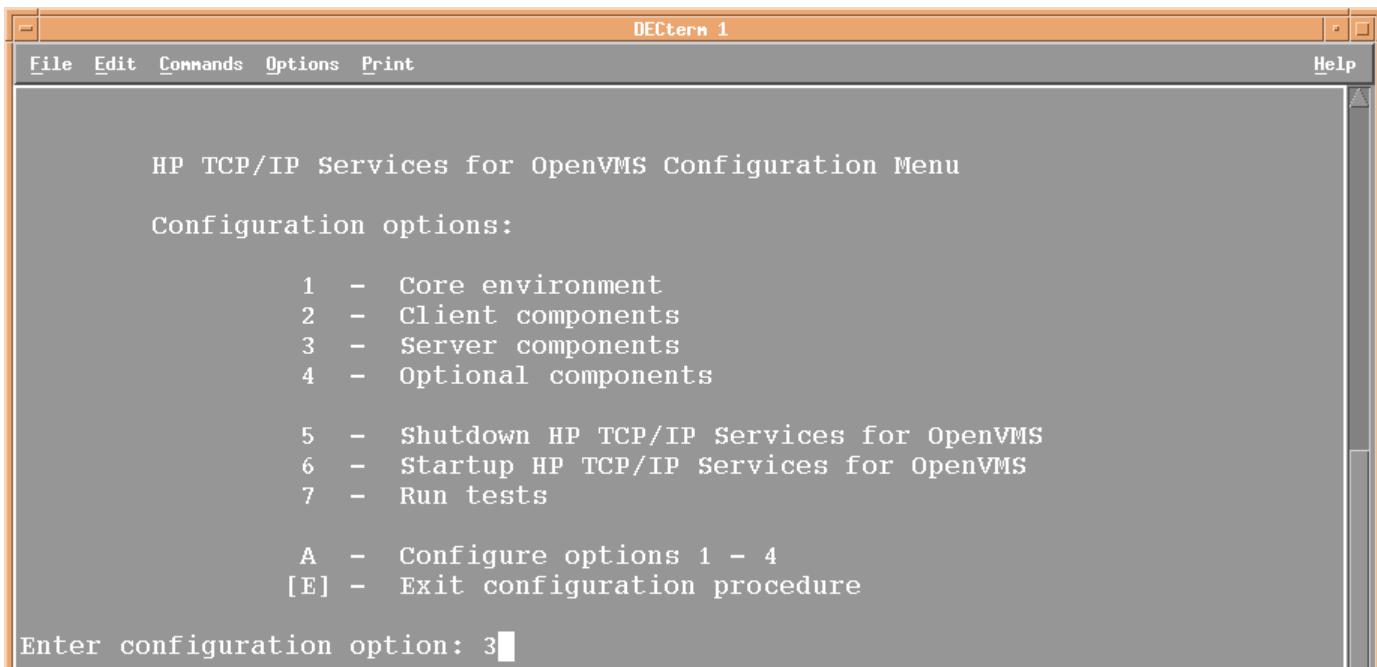

```
SET DEF SYS$SPECIFIC:[TCPIP$NTP]  
COPY TCPIP$NTP.TEMPLATE TCPIP$NTP.CONF /PROT=W:WRED  
ED TCPIP$NTP.CONF
```

Then add the line: `server nnn.nnn.nnn.nnnn`

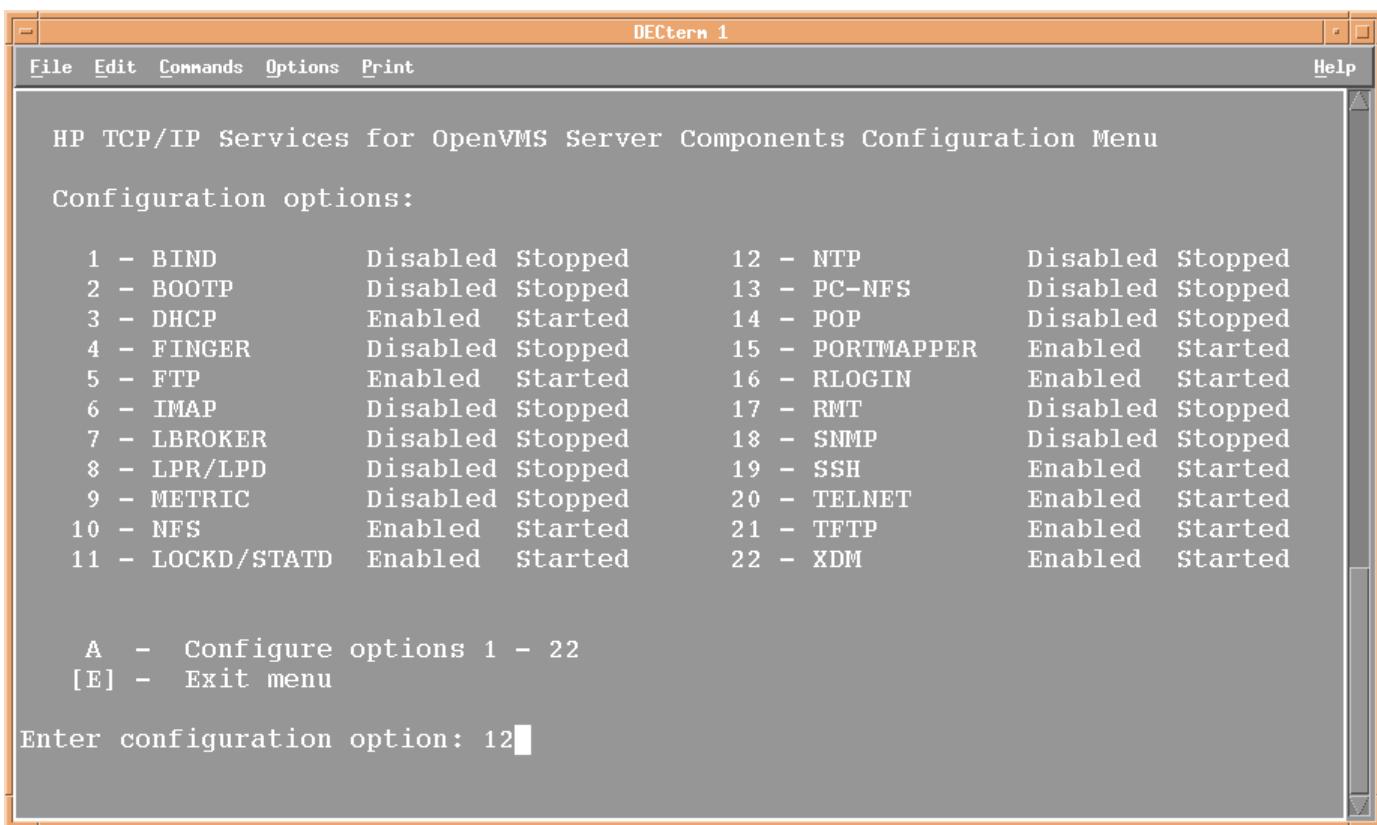

Where `nnn.nnn.nnn.nnnn` is the TCP/IP address of the server you want to sync to. All other lines should be commented out with `#` except for the line that starts with `driftfile`. After saving the changes to the file execute the following commands:

```
SET DEF SYS$LOGIN  
@TCPIP$CONFIG
```

Once in the HP TCP/IP Services menu, select option 3 – Server components.

In the next menu, select option: 12 - NTP

Then in the final menu, select option: 2 to Start and Enable the NTP Server Service.

DECterm 1

**NTP Configuration**

Service is defined in the SYSUAF.  
 Service is defined in the TCPIP\$SERVICE database.  
 Service is not enabled.  
 Service is stopped.

NTP configuration options:

- 1 - Enable service on this node
- 2 - Enable & start service on this node
- [E] - Exit NTP configuration

Enter configuration option: 2

After selecting option: 2 and pressing the Enter key, some additional messages will appear, like shown below:

```
Enter configuration option: 2
%TCPIP-I-INFO, image SYS$SYSTEM:TCPIP$NTP.EXE installed
%TCPIP-I-INFO, logical names created
%TCPIP-I-INFO, service enabled
%TCPIP-S-STARTDONE, TCPIP$NTP startup completed
Press <ENTER> key to continue ...
```

If you see ...startup completed in the list of output messages then the NTP Server Service has been started successfully.

Press the Enter key to continue. Then press the E key twice to close the TCP/IP Services menu.

To check the operation of NTP look in the log file located at `SYS$SPECIFIC:[TCPIP$NTP]TCPIP$NTP_RUN.LOG`

## NFS setup

### Pre-Requisites

Both the server and client must have TCP/IP installed.

Both the server and client must have the TCPIP startup line in the SYSTARTUP\_VMS.COM uncommented and TCPIP running, for example:

```
$ @tcpip$startup:tcpip$startup.com
```

Check that the services NFS, BIND and PORTMAPPER have been configured on the server.

```
tcpip
```

Service	Port	Proto	Process	Address	State
BIND	53	TCP/UDP	TCPIP\$BIND	0.0.0.0	Enabled
...					
MOUNT	10	UDP	TCPIP\$NFS_M	0.0.0.0	Enabled
NFS	2049	UDP	TCPIP\$NFS	0.0.0.0	Enabled
PORTMAPPER	111	TCP/UDP	TCPIP\$PORTM	0.0.0.0	Enabled

(If services are not enabled see section 4).

Shutdown and Restart TCP/IP

### Example Server Setup

**NB:** Configuring NFS is a potentially complex project. The following section is intended as an outline guide only. For more information, consult the HP TCP/IP Services for OpenVMS (Management) documentation (HP part number: AA-LU50M-TE).

**Example server is an OpenVMS system called IPALPH, with TCP/IP address 159.75.55.92**  
**Example client is an OpenVMS system called IPBETA, with TCP/IP address 159.75.55.93**

On the server, add the client host to the local table of known hosts:

```
TCPIP> set host "ipbeta" /address=159.55.75.93 /alias=ipbeta
```

**Note:** Alias name should be different – use lower case and upper case.

Setup a mapping for the OpenVMS disk device you wish to export (eg "DKA0:") to a Unix style pathname. (e.g. "/mydisk"):

```
TCPIP> map "/mydisk" dka0:
```

Save the mapping configuration to the configuration database:

```
TCPIP> set configuration map "/mydisk" dka0:
```

Add the directories that you wish to share to the export database using Unix style pathnames.

Example 1: to share the whole of disk DKA0:

```
TCPIP> add export "/mydisk/000000" /host=ipbeta
```

Example 2: to share just the TESTER directory on DKA0:

```
TCPIP> add export "/mydisk/000000/tester" /host=ipbeta
```

**Note:** The /HOST parameter specifies the client that will have access to the shared directory.

For each user on the client that needs to access the shared directory, add an NFS proxy. If the server needs to be accessible to a UNIX client, you should also create NFS proxies for the standard UNIX users (known as "root" and "nobody"):

```
TCPIP> add proxy tester /uid=100 /gid=15 /host=ipbeta
TCPIP> add proxy tcpip$nfss /uid=0 /gid=0 /host=ipbeta
TCPIP> add proxy tcpip$nobody /uid=-2 /gid=-2 /host=ipbeta
```

## Example Client Setup

**NB: Configuring NFS is a potentially complex project. The following section is intended as an outline guide only. For more information, consult the HP TCP/IP Services for OpenVMS (Management) documentation (HP part number: AA-LU50M-TE).**

**Example server is an OpenVMS system called IPALPH, with TCP/IP address 159.75.55.92**  
**Example client is an OpenVMS system called IPBETA, with TCP/IP address 159.75.55.93**

On the client, add the server information to the table of known hosts:

```
TCPIP> set host "ipalph" /address=159.55.75.92 /alias=ipalph
```

Add NFS proxies for the client users that will be accessing the shared directory. This must match the proxies set up on the server:

```
TCPIP> add proxy tester /uid=100 /gid=15 /host=ipalph
```

(If the server is a UNIX system, the UID and GID of the user must match the UID and GID of the user in the UNIX "password" file.)

Issue a mount command like these examples (this command MUST be issued by a user that has either a NFS proxy entry, or a UNIX password file entry).

Example 1: to mount the shared directory "/mydisk/000000" from server IPALPH on the client IPBETA:

```
TCPIP> mount dnfs1: /host="ipalph" /path="/mydisk/000000"
```

Example 2: to mount the shared directory "/mydisk/000000/tester" from the server IPALPH on the client IPBETA:

```
TCPIP> mount dnfs1: /host="ipalph" /path="/mydisk/000000/tester"
```

Add the appropriate "mount" command to the system startup file (or the user's login.com file) to ensure that the shared directory is re-mounted after a reboot.

**Note:** The /NOADF qualifier with the MOUNT command may be needed with some NFS servers otherwise a 'Device Timeout' error is returned. This disables the ADF files that store the VMS attributes of each file (eg: if binary or text). These attributes are restored automatically when using the ipTEST server S/W.

## SAMBA

Samba allows a PC running MS Windows to map a drive to a tester.

TCP/IP must be installed for this to run.

**Note:** Before doing the install it is first advisable to do an Image Backup of the system disk

To install Samba you must load the latest distribution set (+ any VMS patches) from the HP website and FTP it onto the Itanium (put them into the root of hard disk and follow instructions below)

**Note:** For users on versions of VMS from V8.4-1H1 and above supplied by VSI and not HP Samba comes as a layered product on the VMS Installation DVD and the HP kit will fail to install. However it has been found that installing directly from the VMS DVD failed to create the necessary Samba accounts so the kit must be copied off the installation DVD first.

Login as system and `set def sys$sysdevice:[000000]` and type:

```
RUN HP-I64VMS-SAMBA-T0101--1.PCSI_SFX_I64EXE
```

```
PRODUCT INSTALL *
```

Then select Samba and install. After installation is completed type:

```
@SYS$STARTUP:SAMBA$DEFINE_ROOT  
@SAMBA$ROOT:[BIN]SAMBA$DEFINE_COMMANDS
```

Now Samba needs to be configured:

```
@SAMBA$ROOT:[BIN]SAMBA$CONFIG
```

This will give the menu:

```
HP OpenVMS CIFS Main Configuration Options Menu
```

Configuration options:

- 1 - Core environment
- 2 - Generic options
- 3 - System specific setup
- A - Configure options 1 - 3
- [E] - Exit Menu

Enter configuration option:

Use the 'A' option. Change the `Domain/Workgroup name` to your name and set `WINDBIND` to 'yes' and when asked use example range of IDs when asked. Set the 'Server type' to `Standalone` and leave 'Security Mode' set to `User`. The Core parameters should be like this:

1. Enable WINBIND mapping: yes
  - 1A. UIC Group number range: 1000-2000
  - 1B. POSIX Group IDentifier range: 5000-10000
2. Passdb backend: tdbsam
3. Domain/Workgroup name: IPTESTLTD
4. Server role: STANDALONE
5. Server computer/netbios name: S0437

If using the second network port it may be necessary to set `Restrict Network interface` to 'yes' and enter the TCP/IP address set on this port

The default account for Samba is `CIFSADMIN`. To add the tester account (and similarly any other accounts):

```
@SAMBA$ROOT:[BIN]SAMBA$MANAGE_CIFS
```

This will give the menu:

```
HP OpenVMS CIFS Server Management Main Menu
```

Management options:

- 1 - Manage Shares
- 2 - Manage Groups
- 3 - Manage Users
- 4 - Manage Account Policies
- 5 - Manage Trusts
- [E] - Exit

Enter CIFS Server management option:

As well as allowing mapping to individual accounts shares may be created. Do this from option 1 and set Share name, Share Path and enable 'Guest Access'.

Alternatively the `PDBEDIT` utility can be used:

```
PDBEDIT -A TESTER
```

```
and type the password (probably use 'iptester' unless it's been changed)
```

To start samba type:

```
@SYS$STARTUP:SAMBA$STARTUP.COM
```

Samba uses the SMDB process. If this fails to start type:

```
@samba$root:[bin]samba$smbd_setup_tcpip
```

To shutdown samba type:

```
@SYS$STARTUP:SAMBA$SHUTDOWN.COM
```

**Note:** To run the Samba configuration utility Samba must be shutdown

Edit the system startup file by typing:

```
ED SYSTARTUP_VMS.COM
```

and add the following at the end (before the EXIT line if there is one)

```
$ @SYS$STARTUP:SAMBA$DEFINE_ROOT.COM  
$ @SAMBA$ROOT:[BIN]SAMBA$DEFINE_COMMANDS  
$ @SYS$STARTUP:SAMBA$STARTUP.COM
```

and type EXIT to save.

Now reboot. When rebooted you should now be able to map a drive from the PC from [My Computer->Tools->Map Network Drive](#) and entering `\s0428\tester` and then the name and password of tester and iptester when asked. (also click reconnect at login)

Any further customisation is done in the Samba configuration file (SMB.CONF) in the `samba$root:[lib]` directory.

**Note:** Note this can be done manually or using a front end tool called SWAT. See the Samba website for more detail

For example:

```
# Samba config file created using SWAT  
# from 159.75.55.144 (159.75.55.144)  
# Date: 2008/04/21 13:06:09

[global]
    workgroup = IPTESTLTD
    server string = Samba %v running on %h (OpenVMS)
    passdb backend = tdbsam
    log file = /samba$root/var/log_%h.%m
    domain logins = Yes
    domain master = Yes
    ldap ssl = no
    create mask = 0755

[homes]
    comment = Home Directories
    read only = No
    create mask = 0750
    vfs objects = varvfc

[tester]
    comment = tester read-write
    path = DKA0:[TESTER]
    write list = allwright, johna
    read only = No
    vfs objects = varvfc
```

## TCP/IP Multihoming

### About Multihoming

The term 'multihoming' means using more than one IP address, usually on physically separate networks, to point to the same physical computer. This requires multiple network cards (one per IP address you want to use). For example, the Tester System could be connected to a device handler via a TCP/IP network, and it may also be required to connect it to a separate factory network to allow remote control of the Itanium workstation. This would require multihoming.

### Procedure

This procedure assumes that TCP/IP has already been configured on the first port (See [Appendix F1](#)) and that you have been provided with a valid TCP/IP network address to use on the second port.

Log out all users

Log in as SYSTEM.

Connect a network cable into the second ethernet port (WE1) and connect the other end to the required network.

Start the TCP/IP Config program

```
$ SET DEF SYS$LOGIN  
$ @tcpip$CONFIG
```

At the menu press 1 to enter the CORE ENVIRONMENT MENU

In the CORE ENVIRONMENT MENU press 4 to configure the interfaces

You will be shown the current configuration of WE0 (port A) and be asked "Do you want to reconfigure WE0"  
Respond 'NO'

You will be asked "Do you want to reconfigure WE1" (port B)  
Respond 'YES'

You will then be asked "Enter Unqualified Host Name"  
Enter the Hostname (eg S0XXX)

You will then be asked "Enter internet address"  
Enter the IP address provided by the site

You will then be asked "Enter internet network mask"  
Enter the Network mask provided by the site

You will then be asked "Enter broadcast mask"  
Enter the Broadcast mask provided by the site

You will then be asked "is the above correct"  
Review the settings and if they are correct respond 'YES'

Press 'E' to return to the main menu

Press '5' to Shutdown TCP/IP services

When you are returned to the main menu press '6' to start the TCP/IP services with the changes you just made

Once the network has started Press 'E' to exit the config program

To test both connections type

```
$ tcpip  
tcpip> PING [Address of machine on first network]  
tcpip> PING [Address of machine on second network]
```

Assuming both addresses respond, multihoming is now configured.

## DECnet over TCP/IP

By default the DECnet installed is DECnet phase IV. As this is a different network protocol it may be blocked by routers. By upgrading to DECnet plus it is possible to configure the DECnet protocol to be sent as TCP/IP packets. Upgrade as follows:

### Upgrading Decnet Phase IV to Decnet Plus

1. First CLISYMTBL must be increased for decnet plus to be able to run

Login as system and get to the \$ prompt

```
$ run sys$system:sysgen  
Sysgen> use active  
Sysgen> set clisytbl 750  
Sysgen> write active  
Sysgen> write current  
Sysgen> exit
```

2. Remove DECNET Phase IV and install DECNET Plus

Shut down and boot from the correct binaries CD/DVD for the system.

The following information was collected from VMS8.3-1H1, other versions may vary especially the menu listings so be careful that menu entries are for the correct item. A complete list of all text displayed on screen is given in appendix 1

When the menu appears select *i;**½Remove installed Products**½*

```
Enter device name for target disk: [DKA0:] (? for choices) dka0
```

```
Do you always want detailed descriptions? (Yes/No) [No] no
```

```
Choose one or more items from the menu: 4 (DECNET PHASE IV)
```

```
Do you want to continue? [YES] yes
```

```
Do you want to continue? [YES] yes
```

When the menu appears select *i;**½Install or upgrade layered products**½*

```
Enter device name for target disk: [DKA0:] (? for choices) dka0
```

```
Do you always want detailed descriptions? (Yes/No) [No] no
```

```
Choose one or more items from the menu: 7 (DECNET PLUS)
```

```
Do you want to continue? [YES] yes
```

```
Do you want the defaults for all options? [YES] yes
```

```
Do you want to review the options? [NO] no
```

When the menu appears select *i;**½Shut down this system**½*

### 3. Configuring Decnet plus

Boot the computer from the hard disk.

Login as system and get to the \$ prompt.

```
$ @sys$manager:net$configure

A complete list of all text displayed on screen is given in appendix 2

* Do you want the fast default configuration? [YES] : yes

* Enter PhaseIV Address [50.222] : 50.xxx
where xxx is the serial number of the tester.

* Do you want to apply this configuration? [YES] : yes

* Do you want to start the network? [YES] : yes
```

### 4. Alter tcip to work with Decnet Plus

```
@sys$manager:tcpip$config
```

```
Enter configuration option: 4 (Optional components)
```

```
Enter configuration option: 1 (Configure PWIP driver)
```

```
Enter configuration option: 1 (Enable service on this node)
```

```
Exit out of the TCPIP configuration and reboot the computer
```

### 5. Install ipstest software V5.00 or later

## Appendix 1

```
*****
```

You can install or upgrade the OpenVMS I64 operating system  
or you can install or upgrade layered products that are included  
on the OpenVMS I64 distribution media (CD/DVD).

You can also execute DCL commands and procedures to perform

"standalone" tasks, such as backing up the system disk.

Please choose one of the following:

- 1) Upgrade, install or reconfigure OpenVMS I64 Version V8.3-1H1
- 2) Display layered products that this procedure can install
- 3) Install or upgrade layered products
- 4) Show installed products
- 5) Reconfigure installed products
- 6) Remove installed products
- 7) Find, Install or Undo patches; Show or Delete Recovery Data
- 8) Execute DCL commands and procedures
- 9) Shut down this system

Enter CHOICE or ? for help: (1/2/3/4/5/6/7/8/9/?) 6

\*\*\*\*\*

This procedure will ask a series of questions.

( ) - encloses acceptable answers  
[ ] - encloses default answers

Type your response and press the key. Type:

? - to repeat an explanation  
^ - to change prior input (not always possible)  
Ctrl/Y - to exit the installation procedure

You must enter the device name for the target disk on which the operation will be performed.

Enter device name for target disk: [DKA0:] (? for choices) dka0

DKA0: is labeled I64SYS.

The remove operation can provide brief or detailed descriptions.  
In either case, you can request the detailed descriptions by typing ?.

Do you always want detailed descriptions? (Yes/No) [No]

- |  |                          |
|--|--------------------------|
| 1 - HP I64VMS AVAIL_MAN_BASE V8.3-1H1  | Layered Product          |
| 2 - HP I64VMS CDSA V2.3-306            | Layered Product          |
| 3 - HP I64VMS CSWB V1.7-13             | Layered Product          |
| 4 - HP I64VMS DECNET_PHASE_IV V8.3-1H1 | Layered Product          |

| E - Exit                               |                          |

Choose one or more items from the menu: 4

The following product has been selected:

HP I64VMS DECNET\_PHASE\_IV V8.3-1H1 Layered Product

Do you want to continue? [YES]

%PCSI-W-OPTREF, product HP I64VMS DECNET\_PHASE\_IV V8.3-1H1 is referenced by HP I64VMS OPENVMS V8.3-1H1

This software dependency is expressed in a configuration option that was selected for the referencing product. If you decide to override the recommendation to terminate the operation, the referenced product will be removed, but an optional component of the referencing product may no longer function correctly because of the unsatisfied dependency.

Please review the referencing product's documentation on configuration requirements. Consider using PRODUCT RECONFIGURE to deselect the option.

Answer YES to the following question to terminate the PRODUCT command. However, if you are sure you want to remove the referenced product then answer NO to continue the operation.

Do you want to continue? [YES]

The following product will be removed from destination:

HP I64VMS DECNET\_PHASE\_IV V8.3-1H1 DISK\$I64SYS:[VMS\$COMMON.]

Portion done: 0%...10%...20%...30%...40%...50%...60%...70%...80%...100%

The following product has been removed:

HP I64VMS DECNET\_PHASE\_IV V8.3-1H1 Layered Product  
%PCSIUI-I-COMPWERR, operation completed after explicit continuation from errors

The remove operation is now complete.

Process I64VMS\_INST\_LP logged out at 1-JUN-2011 11:55:18.93

Press Return to continue...

\*\*\*\*\*  
You can install or upgrade the OpenVMS I64 operating system or you can install or upgrade layered products that are included on the OpenVMS I64 distribution media (CD/DVD).

## Appendix 2

```
$ @sys$manager:net$configure
Copyright 2007 Hewlett-Packard Development Company, L.P.

DECnet-Plus for OpenVMS network configuration procedure

This procedure will help you create or modify the management scripts
needed to operate DECnet on this machine. You may receive help about
most questions by answering with a question mark '?'.

%NET$CONFIGURE-I-SETUPNEW, setting up for new configuration
%NET$CONFIGURE-I-PHASEIVDATA, Phase IV DECnet database found

FAST CONFIGURATION OPTION

*** Not supported on cluster nodes.

You have the option of using the existing Phase IV information
to quickly configure DECnet-Plus. This provides full network access
and uses a local file to hold naming information. Very few questions
will be asked.

If you want to use the fast configuration option, answer YES to the next
question.

If you are running a DNS Server on this system, or plan to run a DNS
Server on this system, you *must* answer NO to the next question.
```

If you want more flexibility when configuring DECnet-Plus, also answer NO.

Answering NO will cause some additional questions to be asked regarding configuration.

\* Do you want the fast default configuration? [YES] :  
%NET\$CONFIGURE-I-PHASEIVCOMPL, Phase IV database conversion complete

A DECnet-Plus system may or may not use a DECnet Phase IV-style node address. A node address of 0.0 indicates that this DECnet-Plus system will be communicating with OSI systems only. If your network contains some systems running DECnet Phase IV, you may want to specify a compatible address in order to communicate with them. If your network consists solely of OSI systems, this is not required.

The DECnet Phase IV node address consists of an area number (between 1 and 63), and a node number within the area (between 1 and 1023).

\* Enter PhaseIV Address [50.222] :

NET\$CONFIGURE has determined that you have multiple broadcast circuits. Your system has been configured to enable Phase IV addressing on only one of those circuits. When Phase IV addressing is enabled, the datalink MAC address is set according to Phase IV addressing rules (i.e. AA-00-04-00-nn-nn).

It is undesirable (and invalid) for more than one circuit using Phase IV addressing to be connected to the same LAN. However, if your circuits are on distinct and separate LANs, and the Phase IV style MAC address is desired on more circuits, you may edit the SYSSMANAGER:NET\$ROUTING\_STARTUP.NCL script prior to starting your network. For example, you would change the following command:

```
SET NODE 0 ROUTING CIRCUIT SVA-1 ENABLE PHASEIV ADDRESS = FALSE
```

%NET\$CONFIGURE-W-NOPWIP, DECnet over IP requires the PWIP driver to be enabled  
%NET\$CONFIGURE-W-NODOMAIN, DECnet over IP requires DOMAIN in the directory services list  
%NET\$CONFIGURE-I-CREDEFOSITEMPLATE, created default OSI templates  
%NET\$CONFIGURE-I-EVDDEFAULT, providing default Event Dispatcher configuration  
%NET\$CONFIGURE-I-MAKEACCOUNT, this procedure creates user account CML\$SERVER

#### Summary of Configuration

##### Node Information:

Directory Services Chosen:	LOCAL
Primary Directory Service:	LOCAL
Node Synonym:	S0222
Phase IV Address:	50.222
Phase IV Prefix:	49::
Session Control Address Update Interval:	10
Routing Node Type:	ENDNODE
Autoconfiguration of Network Addresses:	Enabled
Routing ESHello Timer:	600
Routing ES Cache Size:	512

##### Device Information:

Device: EIB (EI/82558):	
Data Link name:	EIA-1
Routing Circuit Name:	EIA-1
Device: EIA (EI/82558):	
Data Link name:	EIA-0
Routing Circuit Name:	EIA-0

##### Transport Information:

NSP Transport:	Configured
Maximum number of logical links:	200
Maximum Transmit and Receive Window:	20
Maximum Receive Buffers:	4000
Flow Control Policy:	Segment Flow Control

```

OSI Transport: Configured
  Maximum number of logical links: 200
  Maximum Transmit and Receive Window: 20
  Maximum Receive Buffers: 4000
  Flow Control Policy: Segment Flow Control

OSI Transport: Configured
  Maximum number of logical links: 200
  Maximum Transmit and Receive Window: 20
  Maximum Receive Buffers: 4000
  OSI applications over TCP/IP: Enabled
  DECnet applications over TCP/IP: Enabled
  DECnet/OSI over TCP/IP interface(s): ALL

Congestion Avoidance Disabled

Event Dispatcher Configuration:

Sinks: local_sink
Outbound Streams: local_stream
Phase IV Relay: Enabled

* Do you want to apply this configuration? [YES] : yes
%NET$CONFIGURE-I-CHECKSUM, checksumming NCL management scripts
* Do you want to start the network? [YES] : yes

```

### Appendix 3

```

$ @sys$manager:tcpip$config

          TCP/IP Network Configuration Procedure

This procedure helps you define the parameters required
to run HP TCP/IP Services for OpenVMS on this system.

Checking TCP/IP Services for OpenVMS configuration database files.

```

HP TCP/IP Services for OpenVMS Configuration Menu

Configuration options:

- 1 - Core environment
- 2 - Client components
- 3 - Server components
- 4 - Optional components
  
- 5 - Shutdown HP TCP/IP Services for OpenVMS
- 6 - Startup HP TCP/IP Services for OpenVMS
- 7 - Run tests
  
- A - Configure options 1 - 4
- [E] - Exit configuration procedure

Enter configuration option: 4

HP TCP/IP Services for OpenVMS Optional Components Configuration Menu

Configuration options:

- 1 - Configure PWIP Driver (for DECnet-Plus and PATHWORKS)
- 2 - Configure SRI QIO Interface (INET Driver)
- 3 - Set up Anonymous FTP Account and Directories
- 4 - Configure Kerberos Applications
- 5 - Configure failSAFE IP
  
- A - Configure options 1 - 5

[E] - Exit menu

Enter configuration option: 1

#### TCPIP Transport for DECnet and Pathworks Service Configuration

Service is enabled on specific node.  
Service is started.

TCPIP Transport for DECnet and Pathworks Service configuration options:

- 1 - Enable service on this node
- 2 - Start service on this node
- 3 - Disable & Stop service on this node

[E] - Exit PWIP\_DRIVER configuration

Enter configuration option:

#### HP TCP/IP Services for OpenVMS Optional Components Configuration Menu

Configuration options:

- 1 - Configure PWIP Driver (for DECnet-Plus and PATHWORKS)
  - 2 - Configure SRI QIO Interface (INET Driver)
  - 3 - Set up Anonymous FTP Account and Directories
  - 4 - Configure Kerberos Applications
  - 5 - Configure failsSAFE IP
- A - Configure options 1 - 5  
[E] - Exit menu

Enter configuration option: e

#### HP TCP/IP Services for OpenVMS Configuration Menu

Configuration options:

- 1 - Core environment
  - 2 - Client components
  - 3 - Server components
  - 4 - Optional components
- 5 - Shutdown HP TCP/IP Services for OpenVMS  
6 - Startup HP TCP/IP Services for OpenVMS  
7 - Run tests
- A - Configure options 1 - 4  
[E] - Exit configuration procedure

Enter configuration option: e  
\$

## Glossary of Acronyms

Acronym	Expansion	Explanation
BIND	<b>B</b> erkeley <b>I</b> nternet <b>N</b> aming <b>D</b> aemon	Used to resolve IP addresses to human-readable computer names.
BOOTP	<b>B</b> ootstrapping <b>O</b> perating <b>T</b> hrough <b>P</b> rotocols	Used to assign IP addresses to computers automatically at boot time.
DHCP	<b>D</b> ynamic <b>H</b> ost <b>C</b> onfiguration <b>P</b> rotocol	Used to configure TCP/IP networking options dynamically. This is a more modern and comprehensive version of BOOTP.
FTP	<b>F</b> ile <b>T</b> ransfer <b>P</b> rotocol	Cross-platform IP protocol for transferring files between computers.
LPR	<b>L</b> ine <b>P</b> rinter <b>R</b> emote <b>P</b> rotocol	Originally from UNIX, a printer control protocol.
LPD	<b>L</b> ine <b>P</b> rinter <b>D</b> aemon	Originally from UNIX, a mechanism for controlling a local printer.
NFS	<b>N</b> etwork <b>F</b> ile <b>S</b> ystem	Developed by SUN Microsystems, a cross-platform protocol for sharing directories and files between computers.
NTP	<b>N</b> etwork <b>T</b> ime <b>P</b> rotocol	A protocol for co-ordinating the clock time of computers.
RExec	<b>R</b> emote <b>E</b> xecutive	A mechanism for executing programs on a remote computer.
RLogin	<b>R</b> emote <b>L</b> ogin	A mechanism for logging into a remote computer.
RSH	<b>R</b> emote <b>S</b> hell	Used with RLOGIN (and REXEC) to execute commands on a remote computer.
SMTP	<b>S</b> imple <b>M</b> ail <b>T</b> ransfer <b>P</b> rotocol	The backbone protocol behind E-Mail.
SNMP	<b>S</b> imple <b>N</b> etwork <b>M</b> anagement <b>P</b> rotocol	A systems-management protocol for remote management of any compatible hardware.
TFTP	<b>T</b> rivial <b>F</b> ile <b>T</b> ransfer <b>P</b> rotocol	A simple file transfer protocol, usually used for booting diskless workstations and terminal devices.
